

Keeping your home healthy ...

With rain and colder weather on the way now's the time to give your home a proper health check .

Your Roof

Before treatment

After treatment

This is just one example of a roof that had zero protection. Many roofs have just bare concrete or poor finish and have no proper membrane or the correct sealant to care for our most important asset - our home. **A UniSeal Health Check** is the first step to keeping your home dry and damp-free.

Exterior Coatings

Before treatment

After treatment

We have all seen homes with flaking and chipped paint and this can happen when the quality of the exterior paint just isn't good enough. Poor quality paint can cause problems within the walls of your home leading to damp and other issues. **A UniSeal Health Check** is just what your home needs.

Damp Problems

Damp can be a big problem in Cyprus homes raising concerns about health issues - it can affect asthma sufferers and can even lead to bronchitis or respiratory problems. But it can also easily be corrected. **A UniSeal Health Check** will help keep you and you home healthy.
